I. Site Map

II. Design Choices

To make selection easier and more convenient for the user when scheduling their appointment, I changed the method for location, date, and time selection from a more “aesthetically pleasing” setup to a simple dropdown. When clicking “Forgot password?” and “Enable text messages” the user will be taken directly to their email or messaging platform to immediately finish the user flow. When cancelling the appointment, the user is prompted with a popup that confirms their choice. To make user action more viewable, the menu items change color based on hover.

III. Thoughts

I really struggled with the assignment, as this was my first time attempting Javascript. Although I spent many hours on it, I was unable to implement the functions I wanted - changing the “Appointment Details” page dynamically based on input. I ran into issues with converting form input into objects, as well as retrieving data from local storage and displaying on my html pages. However, I was able to implement more dynamics via the menu, popups, and email/message link triggers, as well as overall refine my user flow on the site, which makes me

happy. I am hoping to be able to implement the dynamic details page that I want by homework 6b.
